1. Videos and audio files are available that play sounds at a specific rhythm (e.g. beta 15-30 Hz) to enhance your abilities (e.g., promote sleep, relaxation, or concentration).
   a) Do you think specific rhythms might be “good” for certain brain functions?
   b) Do you think listening to a rhythm could enhance your abilities?

2. If increases in rhythmic activity occur in two different brain regions (e.g., visual cortex and hippocampus) at the same time, is this evidence that neurons in both regions are cooperatively involved in the same computation?
